```
[1]: from casadi import *  
     from casadi.tools import *
```

Let's revisit briefly the difference between SX and MX

```
[2]: a = MX.sym("a",2,2)  
     b = MX.sym("b",2,2)  
     c = MX.sym("c",2,2)
```

```
[3]: d = a+b  
     e = d*c
```

The element-wise addition and multiplication operators appear just as a single node in the MX expression graph

```
[4]: dotdraw(e)
```

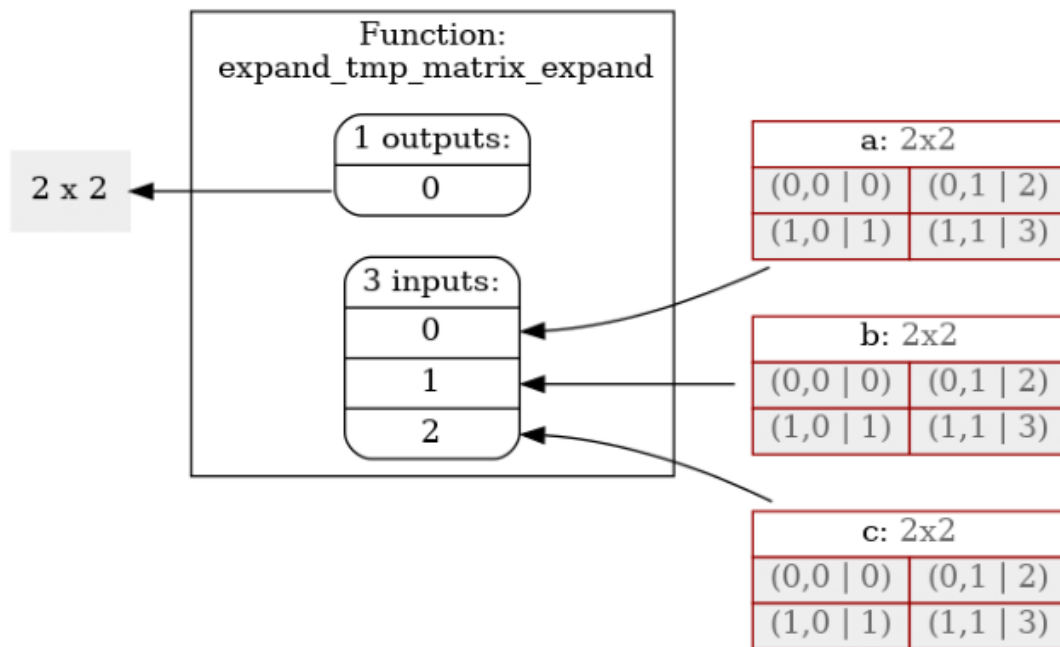

We can use `expand` to expand into subexpressions

```
[5]: f = Function("f", [a,b,c],[e])
      g = f.expand('g')
      dotdraw(g(*g.sx_in()))
```

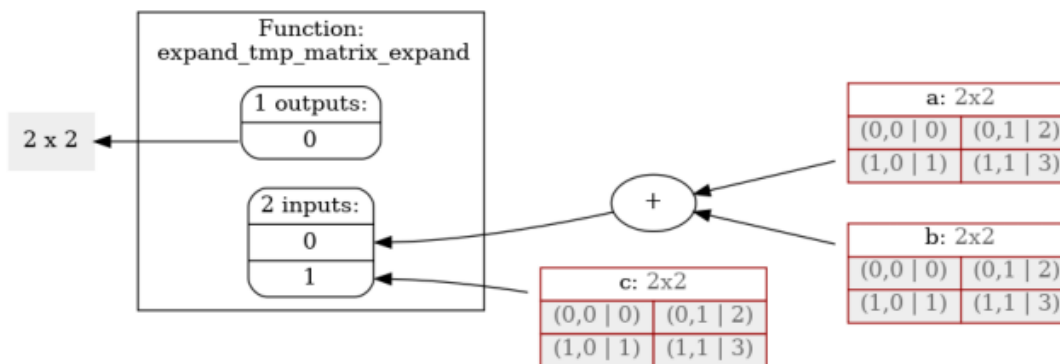

There is also a variant to perform expansion immediately on the MX graph. The expanded SX graph is hidden inside an SX graph call.

```
[6]: dotdraw(matrix_expand(e))
```

An additional features of this variant is that one can choose which expressions remain outside of the expansion scope. In the following we list 'a+b=d' as a node on the boundary of expansion:

```
[7]: dotdraw(matrix_expand(e, [d]))
```

Note how the additions is not expanded, while the multiplication ended up in the expression
