## 1 Exact Hessian

```
[1]: from casadi import *  
from numpy import *  
import casadi as c
```

We will investigate the use of an exact Hessian with the help of the Rosenbrock function

```
[2]: x= SX.sym('x')  
y= SX.sym('y')  
obj = (1-x)**2+100*(y-x**2)**2  
constr = x**2+y**2  
nlp={'x':vertcat(x,y), 'f':obj, 'g':constr}
```

We solve the problem with an exact Hessian (default)

```
[3]: solver = nlpsol('solver', 'ipopt', nlp)
sol = solver(lbx=-10, ubx=10, lbg=0, ubg=1)
print('Optimal solution (exact Hessian): %s' % sol['x'])
```

```
*****
This program contains Ipopt, a library for large-scale nonlinear optimization.
Ipopt is released as open source code under the Eclipse Public License (EPL).
For more information visit https://github.com/coin-or/Ipopt
*****
```

This is Ipopt version 3.14.11, running with linear solver MUMPS 5.4.1.
