```
[1]: from casadi import * from casadi.tools import *
```

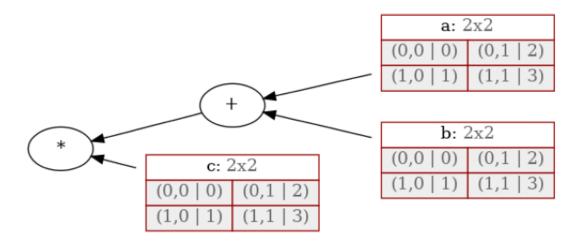

Let's revisit briefly the difference between SX and MX

```
[2]: a = MX.sym("a",2,2)
b = MX.sym("b",2,2)
c = MX.sym("c",2,2)
```

```
[3]: d = a+b
 e = d*c
```

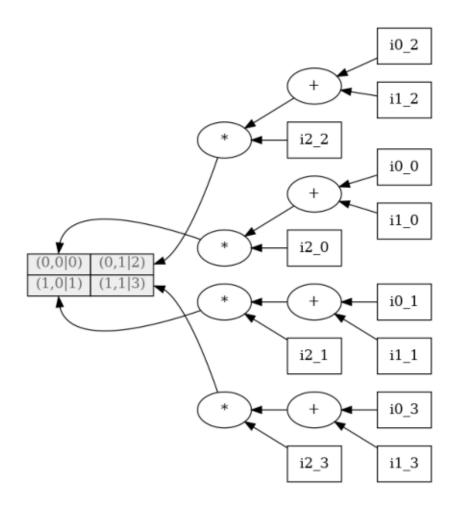

The element-wise addition and multiplication operators appear just as a single node in the MX expression graph

```
[4]: dotdraw(e)
```

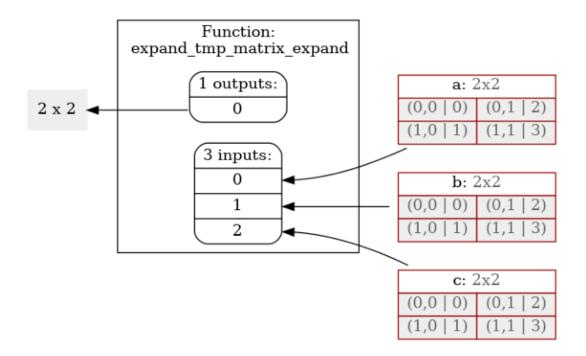

We can use expand to expand into subexpressions

```
[5]: f = Function("f", [a,b,c],[e])
g = f.expand('g')
dotdraw(g(*g.sx_in()))
```

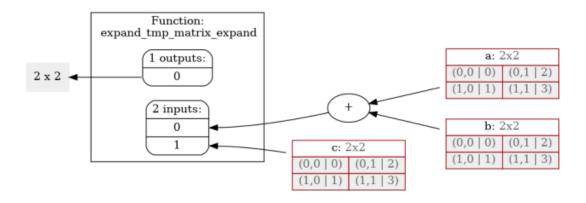

There is also a variant to perform expansion immediately on the MX graph The expanded SX graph is hidden inside an SX graph call

[6]: dotdraw(matrix\_expand(e))

An additional features of this variant is that one can choose which expressions remin outside of the expansion scope. In the following we list 'a+b=d' as a node on the boundary of expansion:

## [7]: dotdraw(matrix\_expand(e,[d]))

Note how the additions is not expanded, while the multiplication ended up in the expression
